

Business Requirements Document (BRD)

Project: Claims Adjuster Case Management Dashboard

Document Version: 1.0

Project Type: Claims Case Management

Business Area: P&C Insurance – Claims

Prepared By: Business Analysis Team

Assigned Trainee: Bindu Chandanam

Status: Draft

Estimated Duration: 2 Weeks

1. Executive Summary

The **Claims Adjuster Case Management Dashboard** is an internal web-based application designed to help claims adjusters efficiently manage and review their assigned insurance claims.

The solution will provide a centralized claims queue where adjusters can view their assigned claims, filter claims based on severity, open individual claim records, review claim information and historical notes, add new notes, and view the updated claim status.

The solution will also introduce a **conversational AI capability** that allows an adjuster to request a quick recap of a claim. The AI agent will analyze the notes associated with the selected claim and generate an accurate **three-sentence summary**.

The initial version will deliberately maintain a limited scope to ensure a simple, focused implementation. Advanced capabilities such as bulk reassignment, complex filtering, claim approval, payment processing, and manager-specific workflows are outside the V1 scope.

Expected Outcomes

- Centralize assigned claims into a single dashboard.
- Enable quick filtering based on claim severity.
- Improve visibility into individual claim information.
- Allow adjusters to add and review claim notes.
- Improve visibility of claim status.
- Reduce time spent manually reviewing multiple notes.

- Provide an on-demand AI-generated claim recap.
 - Establish a simple foundation for future claims workflow enhancements.
-

2. Business Problem

2.1 Current Challenges

Claims adjusters may need to work with multiple claims simultaneously and review historical information before taking action.

When claim information and notes are difficult to review quickly, adjusters may spend additional time manually going through claim records and previous updates.

Current Business Problems

# Business Problem	Business Impact
1 Claims are difficult to prioritize quickly	Adjuster spends more time identifying important claims
2 No simple severity-based filtering	Difficult to focus on high-priority claims
3 Claim information and notes require manual review	Increased review effort
4 Adding and tracking notes can be inefficient	Reduced visibility of recent updates
5 Claim status visibility is limited	Difficult to understand current claim state
6 Historical notes may be lengthy	Adjuster spends time reading multiple notes
7 No quick AI-based recap	Increased time required for claim review

3. Business Objectives

The primary objective is to provide claims adjusters with a simple, centralized case-management dashboard that improves claim visibility and reduces manual review effort.

Key Objectives

1. Provide a centralized claims queue.

2. Allow adjusters to filter claims by severity.
 3. Provide detailed claim information in a dedicated view.
 4. Allow adjusters to add notes to claims.
 5. Display newly added notes immediately.
 6. Maintain claim status visibility.
 7. Provide an AI-powered claim recap capability.
 8. Generate an accurate three-sentence summary from claim notes.
 9. Provide a simple and user-friendly internal dashboard.
 10. Keep the V1 implementation focused and easy to maintain.
-

4. Project Scope

4.1 In Scope

The following capabilities are included in V1:

- Claims queue
- Severity filtering
- Claim detail view
- Claim notes
- Add-note functionality
- Claim status display/update
- Claims API
- Notes API
- Claims database
- Notes database
- Claim-to-notes relationship
- AI note summarization
- Three-sentence claim recap

- Filter correctness testing
- Basic deployment to Google Cloud Run
- Basic wireframe
- User stories
- Acceptance criteria

These deliverables directly correspond to the assigned use case requirements.

4.2 Out of Scope

The following capabilities are explicitly excluded from V1:

- Bulk claim reassignment
- Complex claim reassignment workflows
- Manager-only operational features
- Claim approval/rejection
- Payment processing
- Document management
- Surveyor assignment
- Customer-facing claim submission
- Advanced reporting
- Multiple claim filters beyond severity
- Complex workflow automation
- Advanced analytics

The original assignment specifically states that V1 should remain simple and that there should be no bulk reassignment or manager-only features beyond viewing.

5. Stakeholders

Stakeholder	Responsibility
Claims Adjuster	Primary user; reviews and manages claims

Stakeholder	Responsibility
Claims Manager	View-only access to claim information
Business Analyst	Defines requirements and acceptance criteria
Frontend Developer	Develops React dashboard
Backend Developer	Develops APIs and business logic
Database Developer	Designs and manages claim/notes data
AI/Agent Developer	Implements note summarization
QA/Test Engineer	Validates functionality
Cloud/DevOps	Deploys application to Cloud Run

Primary Actor

Claims Adjuster

The claims adjuster is the primary user of the system and performs the main workflow.

Secondary Actor

Claims Manager

The manager has view-only access in V1.

6. AS-IS Process

6.1 AS-IS Overview

The current scenario assumes that claims adjusters need to review and manage claims through existing internal processes and manually examine claim information and historical notes.

The lack of a focused case-management dashboard can make it harder to quickly identify high-severity claims and understand the latest updates.

6.2 AS-IS Process Flow

START

|

v

Adjuster receives/views assigned claims

|

v

Review available claims

|

v

Identify important claims manually

|

v

Open claim information

|

v

Review previous notes

|

v

Understand current claim status

|

v

Add/update claim notes

|

v

Continue claim processing

|

v

END

7. AS-IS Pain Points

Process	AS-IS Observation	Pain Point
Claim Queue	Claims need to be reviewed	Difficult to prioritize
Prioritization	Severity must be identified	No quick severity filter
Claim Review	Information reviewed manually	Time-consuming
Notes	Historical notes reviewed individually	Longer review time
Note Updates	New information needs to be recorded	Update visibility can be limited
Status	Claim status needs to be checked	Reduced visibility
Recap	Adjuster manually reviews notes	No instant summary

8. FUTURE-STATE / TO-BE Process

8.1 Future-State Vision

The future-state solution will provide a centralized internal claims dashboard where adjusters can quickly identify, review, and update claims.

The system will provide filtering, claim details, notes management, and an AI-powered summarization capability.

Human users will continue to control claim handling decisions. The AI capability will be used only to assist the adjuster by summarizing existing claim notes.

8.2 TO-BE Process Flow

START

|

v

Claims Adjuster opens Dashboard

|

v

View Assigned Claims Queue

|

v

Apply Severity Filter

|

v

Select Claim

|

v

View Claim Details

|

+-----+

|

|

v

v

Review Notes Add New Note

|

|

|

v

|

Save Note

|

|

|

v

|

Note Appears Immediately

|

|

+-----+-----+

|

v

View Claim Status

|

v

"Give me a quick recap"

|

v

AI Agent

|

v

Retrieve Claim Notes

|

v

LLM

|

v

Generate 3-Sentence Summary

|

v

END

The core workflow is based on the assigned requirement: **open queue → filter by severity → open claim → add note → claim status updates.**

9. AS-IS → TO-BE Transformation

AS-IS**TO-BE**

Claims reviewed manually

Centralized claims queue

Difficult to prioritize claims

Severity-based filtering

Claim information reviewed manually

Dedicated claim detail view

Notes reviewed individually

Centralized claim notes

Note updates may have limited visibility

Notes immediately displayed

Status needs to be checked manually

Visible claim status

Adjuster manually reviews all notes

AI-generated recap

No instant claim summary

Three-sentence AI summary

10. Business Requirements

BR-001 — Claims Queue

Requirement:

The system shall provide claims adjusters with a centralized queue containing their assigned claims.

Priority: Must Have

Business Rationale:

To provide a single location for reviewing and accessing assigned claims.

BR-002 — Severity Filtering

Requirement:

The system shall allow the claims adjuster to filter claims based on severity.

Priority: Must Have

Business Rationale:

To allow adjusters to quickly identify claims requiring attention.

Supported values:

- All
 - Low
 - Medium
 - High
-

BR-003 — Claim Detail View

Requirement:

The system shall allow an adjuster to select a claim and view its relevant details.

Priority: Must Have

The claim detail view should display information such as:

- Claim ID
 - Customer
 - Severity
 - Status
 - Incident information
 - Claim description
 - Notes
-

BR-004 — Claim Notes

Requirement:

The system shall allow an authorized adjuster to add notes to a claim.

Priority: Must Have

BR-005 — Immediate Note Visibility

Requirement:

When a note is successfully added, the new note shall immediately appear in the selected claim's notes section.

Priority: Must Have

BR-006 — Claim Status

Requirement:

The system shall display the current status of the claim and update the status according to the defined workflow.

Priority: Must Have

BA Note: The exact status-transition rule is not defined in the supplied use case. Therefore, the final status-transition logic should be confirmed before implementation. The reference material itself previously identified this as an item requiring clarification.

BR-007 — AI Claim Recap

Requirement:

The system shall provide an AI-powered conversational capability that generates a quick recap of the selected claim when requested by the adjuster.

Priority: Must Have

BR-008 — Three-Sentence Summary

Requirement:

The AI agent shall summarize the selected claim's notes into exactly three sentences.

Priority: Must Have

The original requirement explicitly specifies an on-demand three-sentence summary.

11. Functional Requirements

ID	Functional Requirement	Priority
FR-001	Display assigned claims	Must Have
FR-002	Filter claims by severity	Must Have

ID	Functional Requirement	Priority
FR-003	Display claim details	Must Have
FR-004	Display claim notes	Must Have
FR-005	Add claim note	Must Have
FR-006	Immediately display newly added note	Must Have
FR-007	Display claim status	Must Have
FR-008	Update claim status according to defined workflow	Must Have
FR-009	Retrieve claim through API	Must Have
FR-010	Retrieve claims by severity	Must Have
FR-011	Create claim note through API	Must Have
FR-012	Store claims in database	Must Have
FR-013	Store notes in database	Must Have
FR-014	Maintain claim-to-notes relationship	Must Have
FR-015	Invoke AI recap on request	Must Have
FR-016	Generate exactly three sentences	Must Have
FR-017	Restrict manager functionality to viewing	Must Have

The core API operations specified in the original assignment include listing/filtering claims, retrieving an individual claim, and adding a note.

12. Non-Functional Requirements

Category	Requirement
Performance	Dashboard and API operations should respond within an acceptable response time
Usability	Interface should be simple and easy for claims adjusters to use

Category	Requirement
Security	Users should only access functionality permitted by their role
Authorization	Adjusters can manage claims; managers have view-only access
Reliability	Notes should not be lost after successful submission
Data Integrity	Notes must be associated with the correct claim
Scalability	Solution should support increasing numbers of claims
Maintainability	Backend, frontend, database and AI components should be modular
Availability	Application should be available according to the agreed application SLA
Auditability	Important claim/note actions should be traceable where required

13. Business Rules

Rule ID	Business Rule
BR-001	Every claim must have a unique claim identifier
BR-002	Every claim must have a defined severity
BR-003	Severity values shall be restricted to the supported values
BR-004	A note must belong to a valid claim
BR-005	An empty note shall not be submitted
BR-006	Newly created notes must be associated with the selected claim

Rule ID	Business Rule
BR-007	Claims Manager access is view-only in V1
BR-008	Adjusters can add notes to claims they are authorized to manage
BR-009	AI recap must use the selected claim's notes as its source
BR-010	AI recap must contain exactly three sentences
BR-011	AI-generated recap must not intentionally introduce information that is not present in the claim notes
BR-012	Bulk claim reassignment is not supported in V1

14. Exception Scenarios

The BRD should also define what happens when the normal workflow fails.

Scenario	Expected System Behaviour
No claims available	Display an appropriate empty-state message
No claims match severity	Display "No claims found"
Claim cannot be retrieved	Display an error message and allow retry
Empty note submitted	Prevent submission and request valid note text
Note save fails	Show failure message and allow retry
Invalid claim ID	Return appropriate error
Unauthorized user	Deny restricted operation
AI service unavailable	Inform user that recap is temporarily unavailable

Scenario	Expected System Behaviour
Claim has no notes	Inform user that there are no notes available to summarize
AI summary generation fails	Show error and allow retry
AI produces incorrect format	Validate/retry so the final recap meets the three-sentence requirement

15. Roles & Responsibilities

Activity	Claims Adjuster	Claims Manager
View claims queue	✓	✓
Filter claims by severity	✓	✓
Open claim	✓	✓
View claim details	✓	✓
View notes	✓	✓
Add notes	✓	—
Update claim status	✓	—
Request AI recap	✓	View/use as permitted by final access design
Bulk reassignment	—	—
Manager-only operations	—	—

Important: The assignment explicitly defines the manager as **view-only** for V1.

16. Data Requirements

The V1 solution requires two primary entities:

16.1 Claims

Field	Description
claim_id	Unique claim identifier
customer_name	Customer/insured name
severity	Claim severity
status	Current claim status
incident_type	Type of incident
description	Claim description
created_at	Claim creation timestamp
updated_at	Last update timestamp

16.2 Notes

Field	Description
note_id	Unique note identifier
claim_id	Associated claim
note_text	Content of note
created_by	User who created note
created_at	Note creation timestamp

Relationship

One claim can contain multiple notes, which is also explicitly identified in the assignment.

17. Integration Requirements

The V1 system requires the following logical integrations/components:

Integration	Purpose
Claims API	Retrieve claims and claim details
Notes API	Create and retrieve claim notes
Database	Persist claims and notes
LLM/AI Service	Generate claim recap
Authentication/Authorization	Manage user access
Google Cloud Run	Application deployment

AI Integration Flow

18. Reporting & Dashboard Requirements

V1 reporting is intentionally limited.

Claims Dashboard

The dashboard should provide:

- Total visible claims
- Claims queue
- Severity filter
- Claim identifier
- Customer
- Severity
- Status
- Claim selection/navigation

V1 Exclusions

The following are not required:

- Advanced analytics
- Complex KPI dashboards
- Financial reports
- Manager performance reports
- Trend analysis
- Bulk operations

This keeps the implementation aligned with the assignment's **"Keep Simple (v1 scope)"** direction.

19. User Stories

US-001 — View Claims

As a claims adjuster,

I want to view my assigned claims in a centralized queue,
so that I can easily identify the claims I need to work on.

Acceptance Criteria

- Claims are displayed in the queue.
 - Each claim contains basic identifying information.
 - The queue loads successfully.
-

US-002 — Filter by Severity

As a claims adjuster,

I want to filter claims by severity,
so that I can quickly focus on claims of a particular priority.

Acceptance Criteria

- Severity filter is available.
 - User can select All, Low, Medium, or High.
 - Selecting High displays only High-severity claims.
 - Selecting Medium displays only Medium-severity claims.
 - Filter results are accurate.
-

US-003 — View Claim

As a claims adjuster,

I want to open a claim and view its details,
so that I can understand the current claim situation.

Acceptance Criteria

- Selecting a claim opens its detail view.

- Claim information is displayed.
 - Existing notes are displayed.
 - Current status is displayed.
-

US-004 — Add Note

As a claims adjuster,

I want to add a note to a claim,

so that I can record the latest claim-related information.

Acceptance Criteria

- Note input is available.
 - User can enter note text.
 - Empty notes cannot be submitted.
 - Successfully saved notes appear immediately.
 - Note is stored against the correct claim.
-

US-005 — Request AI Recap

As a claims adjuster,

I want to ask the AI agent for a quick recap,

so that I can understand the important information without reading every note.

Acceptance Criteria

- User can request a recap for the selected claim.
 - Agent retrieves the appropriate claim notes.
 - Summary is based on those notes.
 - Summary contains exactly three sentences.
 - Summary does not intentionally introduce unsupported information.
-

20. Acceptance Criteria

The following criteria represent the primary success conditions for V1.

AC-001 — Severity Filter

Given claims with different severity values exist,

When the adjuster selects a severity,

Then only claims matching that severity should be displayed.

AC-002 — Note Addition

Given a valid claim is open,

When the adjuster submits a valid note,

Then the note should be saved and immediately displayed on that claim.

AC-003 — AI Summary

Given a claim contains multiple notes,

When the adjuster requests a quick recap,

Then the agent should generate an accurate three-sentence summary based on those notes.

These three success criteria are directly aligned with the assignment's stated expected outcomes.

21. Assumptions

1. Claims data is available to the application.
2. Users have valid access credentials.
3. Each claim has a unique identifier.
4. Each claim has a severity and status.
5. Notes are associated with claims.
6. The AI service is available when a recap is requested.
7. The AI service can process the available claim notes.
8. The application will initially use sample/test claims for validation.
9. The exact claim-status transition rules will be finalized before implementation.
10. The V1 solution does not require advanced claims processing functionality.

22. Dependencies

Dependency	Purpose
Claims Database	Store claim records
Notes Database/Table	Store claim notes
Backend API	Provide application services
AI/LLM Service	Generate claim summaries
Authentication	Identify users
Authorization	Enforce adjuster/manager permissions
Google Cloud Run	Deployment environment

23. Risks

Risk	Impact	Mitigation
AI generates unsupported information	High	Ground summary strictly in claim notes
AI does not produce exactly 3 sentences	Medium	Validate output format
Incorrect severity filtering	High	Add automated filter tests
Note associated with wrong claim	High	Validate claim ID before persistence
API unavailable	Medium	Error handling and retry
Empty claims dataset	Medium	Provide appropriate empty state
Undefined status transition	Medium	Confirm business rule before implementation
Scope expansion	High	Follow V1 scope strictly

24. KPIs / Success Metrics

Because this is a small V1 assignment, the KPIs should focus on functional effectiveness rather than enterprise-level business metrics.

KPI	Target
Severity filter accuracy	100% for defined test cases
Successful note creation	100% for valid test cases
Immediate note visibility	100% after successful save
AI summary format compliance	Exactly 3 sentences
AI summary accuracy	Accurate for 3 sample claims
Claim retrieval success	Successful for valid claim IDs
Unauthorized modification	No unauthorized write operations
Application deployment	Successfully deployed to Cloud Run

The original assignment specifically expects the severity filter to return correct results in every test and the AI to produce accurate three-sentence summaries for three sample claims.

25. Technical Deliverables

The BRD translates into the following implementation deliverables:

CLAIMS CASE MANAGEMENT SYSTEM

|

| — 1. Business Analysis

| | — BRD

| | — User Stories

| | — Acceptance Criteria

| | — Wireframe

|

└─ 2. Frontend

| └─ React Dashboard

| └─ Claims Queue

| └─ Severity Filter

| └─ Claim Details

| └─ Notes

| └─ AI Recap

|

└─ 3. Backend

| └─ Claims API

| └─ Claim Detail API

| └─ Notes API

| └─ AI Agent Endpoint

|

└─ 4. Database

| └─ Claims

| └─ Notes

|

└─ 5. AI

| └─ Retrieve Notes

| └─ LLM Processing

| └─ 3-Sentence Summary

|

└─ 6. Testing

| └─ Severity Filter Test

The assignment itself identifies the main deliverables as the wireframe, user stories/acceptance criteria, React dashboard, APIs, database, and note-summarization agent.

26. V1 Scope Boundary

This is **very important for your project**.

Your BRD should communicate that you are **not building a complete insurance claims platform**.

You are building a focused:

Claims Adjuster Case Management Dashboard + AI Note Summarization

V1
